Trans. of Kozhevenno-Obuynaya Promyshlennost' (USSR) 1960, no. 3, p. 16-20.

Emulsions of synthetic fatty acids and aluminium alum are used to produce insoluble hydrophobic soaps in the structure of the leather, thus increasing its resistance to water. To raise the wear resistance of the leather, small amounts of synthetic or natural tanning agents and urea-formaldehyde resin are used. The latter is water-soluble and its introduction into the leather raises no technological difficulties. Further condensation polymerization of the resin occurs during drying of the leather.
